TISSUE SPECIFICITY: FOUND IN PETAL AND ADULT TISSUES. HICHEST
LEVELS ARE FOUND IN BONE. ALSO FOUND IN LUNG, OVARY AND UTERUS.
INDUCTION: REGULATED BY TUMOR PROMOTERS AND MITOGENS THROUGH
PROTEIN KINASE C. ALSO INDUCED BY VIRUSES.
PTM: THE ACTIVITY OF TIMP-1 IS DEPENDENT ON THE PRESENCE OF
DISULFIDE BONDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CTCVPPHPQTAFCNSDLVIRAKFVGTPEVNQTTLYQRYEIKMTKMYKGFQALGDAADIRF

-!- FUNCTION: COMPLEXES WITH METALLOPROTEINASES (SUCH AS COLLAGENASES)
AND IRREVERSIBLY INACTIVATES THEM.
-!- SUBCELLULAR LOCATION: Secreted.
-!- PTM: THE ACTIVITY OF TIMP-2 IS DEPENDENT ON THE PRESENCE OF DISULFIDE BONDS.
-!- SIMILARITY: BELONGS TO THE TIMP PAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PDKDIEFIYTAPSSAVCG-VSLDVGGKKEYLIAGKAEGDGKMHITLCDF1VPWDTLSITQ 140

Patent No. 6342374

APPLICANT: Carmichael, David F

APPLICANT: Carmichael, David C

APPLICANT: StrickIn, George P

APPLICANT: StrickIn, George P

APPLICANT: StrickIn, George P

TITLE OF INVENTION: Human Collagenase Inhibitor, Recombinant Vector System

TITLE OF INVENTION: Human Collagenase Inhibitor, Recombinant DNA Method For TITLE OF INVENTION: Manufacture Of Same

TITLE OF INVENTION: Manufacture Of Same

TITLE OF INVENTION: Manufacture Of Same

FILE REFERENCE: Serial No. 614234 09/452,817

CURRENT APPLICATION NUMBER: 08/050,739

PRIOR FILING DATE: 1992-06-07

PRIOR FILING DATE: 1992-03-18

PRIOR FILING DATE: 1992-03-18

PRIOR FILING DATE: 1992-03-08

PRIOR FILING DATE: 1993-03-08

protease inhibitor comprising an alphal-antitrypsin or its functionally active portion and a second protease inhibitor or its functionally active portion and a second protease inhibitor or its functionally continued protease inhibitor of protease activity. The fusion protein of the invention is useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease, cystic fibrosis, ortitis media, ortitis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteins are useful for treating dermarological diseases such as atopic dermaritis, eczema and psoriasis, in inflammancory responses to viral infection, and for treating herpes infection, corneal or epidermal ulceration, chronic non-healing wounds, sepsis, rheumatoid arthritis, periodontal disease, the proposed to the protein disease, and tumour magingenesis, agastric ulceration, corneal or proposed to ulceration, corneal or ulcerat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               osteoporosis, Paget's disease, glomerulonephritis, scleroderma, malaria, bacterial infection, Alzheimer's disease, hypertension and muscular dystrophy. The present sequence represents the human TIMP 1-127 protein

Novel fusion protein useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, comprises a first protease inhibitor comprising alpha 1-antitrypsin and a second protease inhibitor

Example 4; Page 100; 134pp; English.

This invention relates to a novel fusion protein comprising a first protease inhibitor comprising an alphal-antitrypsin or its functionally active portion and a second protease inhibitor or its functionally active portion. The fusion proteins of the invention may act as an inhibitor of protease activity. The fusion protein of the invention is useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease.

C ystic fibrosis, otitis media, otitis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteins are useful for treating dermatological diseases such as atopic dermatitis, eccema as psoriasis, in inflammatory responses to viral infection, and for treating herpes infection, corneal or epidermal ulceration, chronic non-healing wounds, sepsis, rheumatoid arthritis, periodontal disease, tumour metastasis and tumour angiogenesis, gastric ulceration.

C osteoporosis, Paget's disease, glomerulonephritis, scleroderma, malaria, bacterial infection, Alzheimer's disease, hypertension and muscular discretion. of the invention.

                                                                                  밁
                                                                                                                       5
                                                                                                                                                                                                                                                                                                                   CC recombinant vectors and host cells comprising human ovarian antigens of the invention according human ovarian antigens and the use of ovarian antigens polynucleotides and polypeptides in diagnosing, cc treating, prognosing or preventing various ovary and/or breast related disorders. Such conditions include ovarian cancer and breast cancer, and cc metastatic tumours of ovarian or breast origin, reproductive system completes, infections (e.g., infertility, disorders of pregnancy, anovulation, cc polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine cd disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., masticis ophoritis and cc immunodeficiencies, autoimmune ophoritis, systemic lupus erythematosus), communodeficiencies, autoimmune ophoritis, systemic lupus erythematosus), communodeficiencies, autoimmune ophoritis, systemic lupus erythematosus), complication related disorders (e.g., congenital and acquired conductive system disorders, neurological disorders, gastrointestinal disorders (c.g., and urinary system disorders. Ovarian antigen polypeptides and cc polynucleotides may also be used in screening for compounds which compounds which conducted the sequence for gene therapy, chromosome mapping, in the conjugation of individuals and in forensic analysis, and the conjugation of the invention.

CC Note: The sequence data for this patent did not form part of the printed effects when his patent did not format directly from WIPO car fern wino intrinuhmental or sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 11;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         neurological diseases -

The patentors claim the AA SQ of human NIC, DNA sequences coding for NIC, and its RNA analogues and plasmids contg. this DNA. NIC inhibits the activity of metallo-proteinases, esp. of collagenase, proteoglycanase, glatinase or a leucocyte, macrophage or tumour cell metallo-proteinase.

This sequence was used to test the specificity of the monoclonal antibody (MAb) of the invention. The MAb of the invention reacts specifically with human TIMP-3 (see AAW30308), by specific recognition of the TIMP-3 fragments represented by AAW30305-W30307. The MAb can be used in the study or diagnosis of TIMP-3-mediated diseases, particularly for the detection of malignant tumour cells, or the diagnosis of progressiveness of cancers. They can also be used in establishing an immunoassay for TIMP-3 or its equivalent proteins on a large scale. The immunoassay method for TIMP-3 the MAbs is simple, highly reproducible and highly

                                    The anti-TIMP-4 antibodies may be used to treat, prevent or diagnose matastasis of neoplastic cells, angiogenesis and growth tumours such as cervical, uterine, pancreatic, colon or intestinal carcinomas, pregnancy, osteoarthritis, pulmonary emphysema, peridontal disease, rheumatoid arthritis, corneal or diabetic ulcers or ulcers and lesions caused by microorganisms. This sequence represents TIMP-4 which is used to describe the method of the invention.
This invention describes a novel method for the production of antibodies specific for the human tissue inhibitors of metalloproteinase 4, TIMP-4.

these, e.g. brain tumor

The present sequence represents an inhibitor of tissue metalloproteinase, designated TIMP. The specification describes modified forms of TIMP, where the amino-terminal alpha-amino group is modified with an electron accepting group to substantially lose the ability to bind to a metalloproteinase. Modified TIMP-2 prevents an accumulation of active gelatinase. A on the cell surface, and can inhibit the activation of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   closes. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Perimers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
precursor matrix matelloproteinases. The modified TIMP-2 and the compositions comprising TIMP-2 are useful for inhibitual meteastasis of cancer and vascularisation. It is also used for treating diseases associated with them. Specifically, these are useful for preventing or treating metastasis of cancer of the stomach, colon, lung, head and neck, brain tumour, breast, thyroid, prostate, ovary or pancreas, or vascularisation or other conditions associated with these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primers useful for synthesizing full length cDNA clones and their
